NON-INVASIVE SYSTEMIC PBM REHABILITATION

Photobiomodulation (PBM) research has now reached a point, where physical recordable observation, demonstrates that wavelengths within the visible and near-infrared spectrum support homeokinesis and homeostasis within animals and humans. Chronic illness is becoming increasingly common and ongoing medical management combined with a multifaceted approach to treatment can offer patients more favourable outcomes and an improved quality of life.

Non-invasive systemic PBM therapy applied trans-dermally over superficial blood vessels of the wrist or popliteal fossa or under the tongue activates light induced improvements on blood components and blood oxygen transport, rheological blood properties and significant improvement in immune assays and immune competency to support biological function and healing and aid recovery after injury or surgery, which will be discussed during this 30 minute online tutorial.

FOR PRACTITIONERS ONLY

Tutorial Presenter - Tina Czech

DATE: Sunday 21st February 2021

LOGIN TIME: 3.55pm

START: 4pm - 4.30pm **QUESTION TIME:** 4.30- 4.45pm
